

This is the workspace in which she makes her projects. Most of the stuff she uses is really basic equipment. The tool she uses the most is a 'hot air gun'.

This is the 'hot air gun'.

It's used to deform plastic bottles and other plastic stuff.

While it's hot you can twist and turn the plastic object to deform it however you want.

But when you hold it too close it can create little air bubbles in the plastic which make the plastic break more easily.

On the next slide some of the normal equipment she uses are shown, like: a sander, saws, pliers, etc.
